

Tuesday August 2, 2016

At LTO using the 24" with my 13mm eyepiece, yielding 188x.

Seeing and Transparency OK.

M 1-61	10:18 PM	13mm – 188x – A very faint, stellar looking planetary nebulae. Responds well to the O3 filter.
--------	----------	--

MGC +11-19-006	10:37 PM	13mm – 188x – An extremely faint, tiny oval glow. Saw it pop into view twice, for a second, with second view of it the best. Otherwise not there. Had correct star field for it matched the photo I had.
